(x2) means double passes.

Recommended spreader settings are based on a brisk walking speed of approximately 5 km/hour. Please note that these settings are only recommendations. Exact application rates cannot be guaranteed, as they depend on the spreader and the accuracy of the operator. Seasonal variability can cause seed batches to vary in bulk density. Therefore, it is important to calibrate the spreader at regular intervals.

Drop spreaders are not recommended for coated products, such as controlled-release fertilisers, due to potential coating damage during application.

Recommended spreader settings are based on a brisk walking speed of approximately 5 km/hour. These settings are only recommendations, and exact application rates cannot be guaranteed, as they depend on the spreader and the operator's accuracy.

Calibrate the spreader at regular intervals.
